

Test for Principal Web Engineer

Create a nextjs application that handles group ordering.

1. Create a group ordering experience similar to a group order experience in doordash
 - a. Invite users by email address. Capped at 3 participants per group.
 - b. Allow users to add products. - Typical shopping experience with users able to look at the menu and add to cart.
 - c. Only host can checkout. (The checkout functionality can be just a button that shows a summary of the details in the order)
 - d. The host should be able to see the total order broken up by people they have invited.

Create a minimal 2-3 product menu for this use. You are free to come up whatever product you want.

You are free to make architectural decisions like using firebase/supabase in the backend etc. You are free to take liberties with interpretation of the problem.
